Opgave 2. b: På nedenstående billede, kan code coverage over min kode i SKAT projektet ses.

Udfra code coverage analyse kan det konkluderes, at min test har god code coverage, da 95,74% af koden er covered. Ligeledes er de resterende 4,26% af koden, som ikke er covered, tuborgklammer, hvorfor koden alt andet lige må have god code coverage.

Opgave 3. d:

Jeg implementerer en multi-trådet TCP-server ved at implementere et while-loop i min main, i min server, som indeholder en task, som afventer en klient. Jeg har valgt at bruge factory til at gøre min server multi-trådet, da factory opretter en task objekt til hvert objekt, som bliver opfanget.

```
Task.Factory.StartNew(() => afgift.DoIt());
```

Opgave 4. c:

Som det fremgår af ovenstående billede, er klienten i kontakt med serveren, samtidig med, at serveren er i kontakt med de metoder, som findes i SKAT, da serveren kan give klienten det korrekte svar på bilens afgift. Ligeledes fremgår det af billederne, at klienten søger en elbil som koster 200000 kr.

Som det kan ses på dette billede, opfanger WireShark at klienten indtaster "elbil". Og ligeledes fremgår det af de to nedenstående billeder, at Wireshark også fanger at klienten indtaster bilens pris, samt at serveren returnerer bilens afgift.
